MGO (=Marine Gas Oil) *(n)* ***(marine eng)*** Marine Gas Oil or MGO, is a high quality marine fuel that consists exclusively of distillates. Distillates are all those components of crude oil that evaporate during distillation and are then condensed from gas into liquid.

(https://maritimereview.ph/what-is-mgo/); Marine gas oil (MGO) refers to marine fuels that consist solely of distillates, the components of crude oil that evaporate in fractional distillation and are then condensed from the gas phase into liquid fractions. It's similar to diesel but has a higher density and unlike heavy fuel oil (HFO), marine gas oil doesn't need heating during storage.

hrvatski naziv "MINISTARSTVO POMORSTVA" nema prijevodne istovrjednice u engleskom jer se nazivi za takvo ministarstvo razlikuju od države do države i podliježu čestim promjenama, ovisno o sadržaju koji taj pojam obuhvaća ali i strukture samog ministarstva u pojedinim državnim sustavima. Dok su se u povijesti koristili uži nazivi 'ministarstvo pomorstva', 'ministry of navigation' itd., u novije vrijeme *pomorstvo* je u uglavnom nadležnosti viših tijela. Tako je u Hrvatskoj *pomorstvo* u sastavu 'Ministarstva mora, prometa i infrastrukture' Republike Hrvatske. U američkoj britanskoj praksi to ministarstvo predstavlja upravu (administration, *MarAd* u SAD-u) i pripada višim vladinim tijelima (npr. Ministry for Aviation, 'Maritime and Security'je dio višeg tijela, tj.' Department for Trade', DfT u Vel. Britaniji). U NR Kini 'Ministry of Transport' je krovno tijelo, a 'China Maritime Safety Administration' nadležno je ministarstvo za pomorstvo, itd. }

This clause arises because, under American law, a cargo owner is not able to make any recovery from the carrier for damage resulting from negligent navigation but may instead sue the non-carrying ship which in turn seeks recovery from the carrying ship in proportion of his fault. This would render a carrier indirectly liable for a loss for which he is not directly liable to the cargo owner. The Sparidae family is also known as **porgies**. These fish have certain distinctive features that make them easily identifiable. First, their bodies are relatively flat. The line from the dorsal area to the front of the fish descends very rapidly giving the face a flattened appearance, especially when viewed in profile. Their color varies widely from species to species, mainly depending on water type and environment. In brackish waters, for example, the fish tend to be darker, with shades of blacks and grays to help them blend in with the environment. Some fish, in other areas, even have a bright red appearance, showing how diverse members of the family can be. SEE projektiranje broda basic and detail ship design {Our (https://morson-projects.co.uk/services/detail-ship-design/) basic and detail ship design service includes: (a) 3D hull and stability modelling – creating comprehensive digital representations of a vessel's structure and its stability characteristics. This process enables engineers to analyse the ship's behaviour under various conditions, ensuring its safety and efficiency., © Damage stability analysis – assessing a ship's ability to remain stable and afloat in the event of damage to its structure. This crucial aspect of detail ship design helps designers implement measures to enhance a vessel's resilience against potential hazards at sea., (d) Full liaison with class and governmental agencies – essential during detail ship design to ensure compliance with industry regulations and standards. Collaborating closely with these entities facilitates the approval process and ensures that the vessel meets all necessary requirements for operation., (e) Intact stability analysis – evaluating a ship's stability in its undamaged condition. By examining factors such as weight distribution and buoyancy, engineers can optimise the vessel's design to achieve optimal stability performance while maintaining operational efficiency., (f) • As the owners' representative, our experts oversee detail ship design projects on behalf of the ship's owners, ensuring that their interests and requirements are met throughout the process. This role involves coordinating between various stakeholders to achieve the desired outcome efficiently., (g) • Production of stability books and documents – compiling comprehensive records detailing a ship's stability characteristics and operational limitations. These documents serve as valuable references for crew members and authorities, enhancing safety and regulatory compliance., (h) • Specialist stability analysis – including launching, grounding and drydocking assessments, focusing on evaluating a ship's stability during critical phases of its lifecycle. By conducting detailed analyses in these areas, engineers can mitigate risks and ensure safe and efficient operations throughout the vessel's lifespan. }

The sixteenth century saw the shift from shares to wages; at this time a fixed amount of money was paid for labor on a particular voyage. The purpose of the agreement is to achieve the benefits of efficiency for users and their customers without creating restrictions on trade. Pool members' ships are time-chartered to the pool and it is the underlying time charter that provides the basis of the trading relationship between the ship owner and the pool. https://www.engineeringworldchannel.com/ship-launching-explained/ {In preparing for an end launching, usually groundways, made of heavy timbers are laid with an inclination of about 1/2" and 5/8" to the foot parallel to the center line of the ship one on either side of the keel, and spaced about one-third of the beam of the vessel apart. These groundways run the length of the vessel and for some distance out under the water. On top of the groundways are placed the sliding ways, also heavy timbers, and between these two ways is placed a coating of launching grease. The sliding ways are prevented from sliding on the greased groundways by a trigger or similar device and dog or dagger shores. Cradles are built up to fit the form of the vessel, and between the sliding ways and the cradle, wedges are driven and the weight of the ship thus transferred from the building blocks to the sliding ways. After the building blocks and shores are removed, the trigger is released and gravity causes the vessel to slide down the inclined ways. In some cases hydraulic jacks are set at the upper end of the groundways to exert pressure on the sliding ways to assist in overcoming initial friction along the ways.
