

Unit 15**CARGOES & IMDG CODE****Basic terms**

<i>unloading/discharging carriage</i>	<i>loading</i>
<i>bulk cargo</i>	<i>method of packing method of</i>
<i>general cargo</i>	<i>transit</i>
<i>fragility</i>	<i>cargo damage pilferage</i>
<i>tainting</i>	<i>stowage factor</i>
<i>sweating</i>	<i>hale</i>
<i>drum</i>	<i>bag</i>
<i>keg</i>	<i>carton</i>
<i>cask</i>	<i>crate</i>
<i>leakage</i>	<i>carboy</i>
<i>stowage of cargo handling</i>	<i>glass container</i>
<i>barrel</i>	<i>box</i>
<i>hogshead</i>	<i>case</i>

The overall responsibility for the stowage of cargo rests with the **Master**.

In practice, whilst the Master retains overall responsibility, the supervision of stowage of cargo normally is delegated to the **Chief Officer**. His task is to see that neither the ship nor her cargo is damaged.

Furthermore, he is responsible for the safe handling, loading, stowage and carriage, including the custody of the cargo throughout the voyage.

Above all, he must ensure that the **safety of the ship** is not imperilled by the carriage of goods. His aim must be to have the cargo evenly distributed throughout the ship, to ensure her general stability. In practice, it is usual for the ship to be loaded a little deeper art, to improve the vessel's movement through the water.

This is called "*trimmed by the stem*", the term "trim" referring to the difference in draught between the stem and stern.

A ship with a centre of gravity too low will be **stiff** and consequently apt to strain heavily in rough weather. Conversely, a ship with a centre of gravity too high will be **tender** and inclined to roll, thereby creating an unstable vessel.

Basically, there are two types of cargo: bulk and general cargo.

Bulk cargoes present little difficulty in stowage, as they tend to be conveyed in specialized vessels between two ports and are usually loaded and discharged by mechanical means. Cargoes such as grain, coal, copra and similar cargoes, are usually carried in bulk, and must be adequately ventilated during the voyage, as they are liable to spontaneous combustion.

With **general cargo**, or **breakbulk cargo**, the problem is more difficult, and calls for much greater skill. Such cargoes are conveyed generally in cargo liners, provided with numerous decks, including "tween decks". The position is made more difficult not only by the variety of cargoes conveyed, each with its own characteristics such as fragility, tainting, sweating, etc., but also by the wide variety of ports served by the cargo liner. Thus, cargo for later or "deep" ports on the voyage has to be loaded first, and that for earlier ports loaded last. This causes many problems to the stevedore who is responsible to the Master for the discharging and loading.

Container terminals are built and are equipped on the quay face with giant portainer cranes capable of lifting containers in and off the container vessels. A feature of the cranes is the spreader which automatically connects with the top corner castings of each of two containers to lift them. Gantry cranes of 45 tonnes capacity are used to handle the container stack.

UN Recommendation 21

Cargo: The load of goods carried on board a ship or on another means of transport;

Cargo can consist of either liquid or solid materials or substances, without any packaging (e.g. bulk cargo), or of loose items of unpacked goods, packages, unutilized goods (on pallets or in freight containers) or goods loaded on transport units and carried on active means of transport.

Cargo type: A classification of cargo carried, or intended to be carried, on means of transport, based on its general appearance.

Package: The complete product of a packaging operation, as prepared for transport and consisting of the packaging (receptacle, container) and its contained goods;

Packaging: Materials and components used in any packaging operation to wrap, contain and protect articles or substances during transport;

Package type: The shape or configuration of a package as it appears for transport.

(http://www.unece.org/cefact/recommendations/rec21/rec21rev1_ecetrd195e.pdf):

Types of Packaging

The method of packaging (or packing) depends primarily on the nature of the goods themselves and the method of transit for the anticipated voyage. Packing is not only designed as a form of protection to reduce the risk of the goods being damaged in transit, but also to prevent pilferage. There are numerous types of packing.

Many goods have little or no form of packing whatsoever, and are carried **loose**. These include iron and steel plates, iron rods, railway sleepers and steel rails. Such cargoes are generally weight cargoes, with a low stowage factor. Heavy vehicles, locomotives and buses are also carried loose, because of the impracticability and high cost of packing.

Bales are a form of packing consisting of a canvas cover often cross-looped by metal or rope binding. It is most suitable for paper, wool, cotton, carpets and rope.

Bags made of jute, cotton, plastic or paper, are a cheap form of container. They are suitable for cement, coffee, fertilizers, flour and oil cakes. Their main disadvantage is that they are subject to damage by water, sweat, books or, in the case of paper bags, breakage.

Cartons are a very common form of packing, and may be constructed of cardboard, strawboard or fibreboard. This form of packing is very much on the increase, as it is easily handled particularly by palletization. The principal disadvantage is its liability to crushing and pilfering.

Crates are a form of container half-way between a bale and a case. They are of wooden construction. Lightweight goods of larger cubic capacity, such as light machinery, domestic appliances like refrigerators, cycles, and certain foodstuffs, for instance oranges, are suitable for this form of packing.

Carboys, or **glass containers**, enclosed in metal baskets have a limited use, and are primarily employed for the carriage of acids and other dangerous liquids transported in small quantities.

Boxes, cases and metal-lined cases are also used extensively. They are made of wood, vary in size and capacity, and may be

strengthened by the provision of battens and metal binding. Many of them, such as tea chests, are lined to create airtight packing, so as to overcome the difficulties that arise when passing through zones of variable temperature. A lot of machinery and other items of expensive equipment, including cars and parts, are packed in this form.

Barrels, hogsheads and drums are used for the conveyance of liquid or greasy cargoes. The main problem associated with this form of packing is the likelihood of leakage if the unit is not properly sealed, and the possibility of the drums becoming rusty during transit. Acids can also be carried in plastic drums and bottles.

Pallets and containers of standardized form are the most recent types of packing.

Anyport

IMO STANDARD MARINE COMMUNICATION PHRASES (SMCP)

IV-C/I.2 - HANDLING DANGEROUS GOODS (also see IMO-
IMDG Code, 1994)

1.2.1 - *Briefing on nature of dangerous goods*

What is IMO-Class of these goods?

- **IMO-Class of these goods:**
- **This package contains IMO-Class ... goods.**
- **These goods / liquids / substances are flammable / oxidizing / poisonous - handle with caution.**
- **These goods emit flammable gases in contact with water-keep dry.**
- **These goods are liable to spontaneous heating and combustion.**
- **Do not touch**

1.1.6. - *Briefing on stowage and securing.*

Check careful and safe stowage.

Check pro per use of handling gear.

Check careful separation of different lots.

Refuse damaged (crushed/renailed/wet/torn/resewn ... boxes/cartons/cases/ crates/bags/...) .

Do not overstuff cartons with other goods

Do not use books for handling bags.

Place dunnage between tiers.

Fill up broken stowage with small stowage.

Stow ... into tween deck of no. ... hold.

Stow ... in reefer hold.

Stow empty containers in topmost tiers.

Stow container(s) onto hatch cover(s).

Check containers for damage.

Check correct fixing of rope clips.

Secure heavy lift(s) immediately.

Relash all lashings.

A. COMPREHENSION & VOCABULARY

A.1 Decide which of the statements below is true or false:

1. The Chief Officer is most the responsible for the stowage of cargo.
2. The Master and the Chief Officer are responsible for the safety of the ship and the cargo
3. Cargo for "deep" ports is loaded first.
4. The ship tends to roll when the centre of gravity is too low.
5. If the ship is stiff, she will be subject to strain in heavy weather.
6. General cargo and bulk cargoes are handled by mechanical means.
7. Container cranes are fitted with a spreader as a lifting device
8. The sequence of ports of discharge is not a factor which affects the stowage of cargo.

A.2 Complete the following sentences:

1. The method of packing depends on _____ .
2. Packing is designed for _____ .
3. Bales are suitable for conveying _____ .
4. Bags are most suitable for _____ .
5. Bags are subject to damage by _____ .
6. Cartons are made of _____ .
7. Crates are a form of packing used for _____ .
8. Crates are made of _____ .
9. Boxes are strengthened by _____ .
10. The main problems involved in the use of drums are
_____ .
11. The standardized container sizes are _____ .
12. Heavy and bulky cargoes are usually carried
_____ .

A.3 Complete the following text with the terms below:

- **ports** • **stow** • **stowage**
- **seaworthy** • **shift**
- **pilferage** • **discharge** • **hold**

Stowage of cargo

In the 1. _____ the first consideration must be given to safety.

The cargo must be stowed so that the ship will be stable and 2. _____.

_____ . It must be secured in such a manner that it cannot 3. _____

_____ if the vessel encounters bad weather.

Then care must be taken to 4. _____ it so that it is not damaged by other cargo or water which may find its way into the 5. _____ .

Care must be taken to prevent it from 6. _____ or damage while it is being stowed.

Where cargo is shipped for several 7. _____ , arrange it so that you can conveniently 8. _____ it at each port of rotation and that none shall be overcarried.

A.4 Supply the right terms from the reading text:

- **Chief Officer** • **stowage and carriage**
- **bulk cargoes** • **loading**
- **general cargoes** • **stowage**

Types of cargo

The officer in charge of the loading, 1. _____, and safe discharging of the cargo is the 2. _____. Cargo such as bags of flour, boxes of electric equipment, crates of citrus fruit, Pallets with oil drums, is known as 3. _____. On the other hand, cargoes which are carried loose, such as cement, ores, coal, etc., are called 4. _____ .

The 5. _____ and unloading of cargo require much knowledge and skill. The 6. _____ of cargo on board is performed by stevedores.

B. GRAMMAR

B.1 Supply the right form of the verb in brackets and rearrange the sentence as required:

Bulk cargo

Bulk cargo (*divide*) 1. _____ into liquid and dry bulk cargo. Liquid cargo (*carry*) 2. _____ in tankers. Dry bulk cargo (*include*) 3. _____ grain, ores, coal and sugar. It (*load*) 4. _____ automatically by buckets on a conveyor belt system or pneumatically. Dry bulk cargo (*unload*) 5. _____ by huge grabs fitted to gantry cranes or by suction tubes.

B.2 Complete the gaps in this paragraph with a suitable preposition:

General cargo

General cargo can be divided 1. _____ containerized, non-containerized and refrigerated cargo. Most problems arise 2. _____ the stowage 3. _____ non-containerized cargo, because each commodity has a different type 4. _____ packaging. Goods may be packaged 5. _____ bags, bales, cases or steel drums. General cargo is loaded 6. _____ cranes and ship's derricks. Perishable cargoes such as fruit, meat and dairy produce are carried 7. _____ ships 8. _____ refrigerated holds.

B3 Match the definition with the corresponding term

<p>This form of packing is made of jute, cotton, plastic or paper, are a cheap form of container. They are suitable for cement, coffee, fertilizers, flour and oil cakes. Their main disadvantage is that they are subject to damage by water, sweat, books or, in the case of paper bags, breakage.</p>	<p>Boxes, cases</p>
<p>a form of packing consisting of a canvas cover often cross-looped by metal or rope binding. It is most suitable for paper, wool, cotton, carpets and rope.</p>	<p>Crates</p>
<p>Form of packing used for the conveyance of liquid or greasy cargoes. The main problem associated with this form of packing is the likelihood of leakage if the unit is not properly sealed, and the possibility of the them becoming rusty during transit.</p>	<p>Carboys, or glass containers,</p>
<p>This form o packing is made of wood. They vary in size and capacity, and may be strengthened by the provision of battens and metal binding. Many of them, such as tea chests, are lined to create airtight packing, so as to overcome the difficulties that arise when passing through zone s of variable temperature. A lot of machinery and other items of expensive equipment, including cars and parts, are packed in this form.</p>	<p>Bags</p>
<p>Form of containers enclosed in metal baskets, primarily employed for the carriage of acids and other dangerous liquids transported in small quantities.</p>	<p>Barrels, hogsheads and drums</p>
<p>a very common form of packing, and may be constructed of cardboard, strawboard or fibreboard. This form of packing is very much on the increase, as it is easily handled particularly by palletization. The principal disadvantage is its liability to crushing and pilfering.</p>	<p>Pallets and containers</p>
<p>a form of container half-way between a bale and a case. They are of wooden construction. Lightweight goods of larger cubic capacity, such as light machinery, domestic appliances like refrigerators, cycles, and certain foodstuffs, for instance oranges, are suitable for this form of packing.</p>	<p>Bales</p>
<p>Goods which have little or no form of packing whatsoever. These include iron and steel plates, iron rods, railway sleepers and steel rails. Such cargoes are generally weight cargoes, with a low stowage factor. Heavy vehicles, locomotives and buses are also carried in such a way, because of the impracticability and high cost</p>	<p>loose</p>

of packing.	
Packings of standardized form, the most frequent types of packing today	Cartons

B.3 Consider the following phrases associated with damage to the cargo:

- a) The cargo of steel is liable to damage by rust.
- b) The cargo of steel is susceptible to rust.
- c) The cargo of steel is subject to damage by rust.
- d) The cargo of steel lends itself to damage by rust.
- e) The cargo of steel will rust easily if it comes in contact with water.

Use the above underlined phrases wherever possible to transform the following sentences:

1. Cargoes in cartons are liable to crushing.

Cargoes in cartons crushing.

Cargoes in cartons

Cargoes in cartons

Cargoes in cartons

2. Butter is susceptible to tainting with coffee.

.....

.....

.....

.....

.....

3. Coal is liable to shift in heavy weather.

.....

.....

.....

.....
.....

4. Liability to tainting is a characteristic of a cargo of tea.

.....
.....
.....
.....
.....

5. Furniture is liable to mechanical damage and chafing.

.....
.....
.....
.....
.....

6. The cargoes of bananas is liable to slight changes in temperature.

.....
.....
.....
.....
.....

7. Coffee is susceptible to taint with tea.

.....
.....
.....
.....
.....

8. Steel plates will rust easily.

.....

.....
.....
.....
.....

Supplements

Cargoes

The Port of London handles over 50 million tonnes of a wide range of cargoes every year. These include:

- unitised consignments (principally containers and lorry trailers)
- sea-dredged and secondary aggregates
- forest products
- crude oil and petroleum products
- sugar
- vehicles and plant
- cereals
- animal feedstuffs
- edible oils and fats
- chemicals
- fertilisers
- cement
- steel and other metals
- containerised refuse

IMDG Code or International Maritime Dangerous Goods Code

(from Wikipedia)

IMDG Code or **International Maritime Dangerous Goods Code** is accepted as an international guideline to the safe transportation or shipment of [dangerous goods](#) or [hazardous materials](#) by water on vessel. IMDG Code is intended to protect crew members and to prevent marine pollution in the safe transportation of hazardous materials by vessel. It is recommended to governments for adoption or for use as the basis for national regulations.

The implementation of the Code is mandatory in conjunction with the obligations of the members of united nation government under the [International Convention for the Safety of Life at Sea](#) (SOLAS) and the International Convention for the Prevention of Pollution from Ships ([MARPOL 73/78](#)). It is intended for use not only by the mariner but also by all those involved in industries and services connected with [shipping](#). Contains advice on terminology, packaging, labeling, placarding, markings, stowage, segregation, handling, and emergency response.

The code is updated and maintained by the DSC Sub-Committee of the [International Maritime Organization](#) every 2 years.

Dangerous goods, also called **hazardous materials** or **HazMat**, are [solids](#), [liquids](#), or [gases](#) that can harm people, other living [organisms](#), property, or the environment. They are often subject to [chemical regulations](#). "HazMat teams" are personnel specially trained to handle dangerous goods. Dangerous goods include materials that are [radioactive](#), [flammable](#), [explosive](#), [corrosive](#), [oxidizing](#), [asphyxiating](#), [biohazardous](#), [toxic](#), [pathogenic](#), or [allergenic](#). Also included are physical conditions such as compressed gases and liquids or hot materials, including all goods containing such materials or chemicals, or may have other characteristics that render them hazardous in specific circumstances.

Dangerous goods are often indicated by diamond-shaped signage. The colours of each diamond in a way has reference to its hazard i.e.: Flammable = red because fire and heat are generally of red colour, Explosive = orange, because mixing red (flammable) with yellow (oxidising agent) creates orange. Non Flammable Non Toxic Gas = green, due to all compressed air vessels being this colour in [France](#) after World War II. France is where the diamond system of HazMat identification originated.

Mitigating the risks associated with hazardous materials may require the application of safety precautions during their [transport](#), use, storage and [disposal](#). Most countries regulate hazardous materials by law, and they are subject to several international treaties as well. Even so, different countries may use different class diamonds for the same product. For example, in Australia, Anhydrous Ammonia UN 1005 is classified as 2.3 (Toxic Gas) with sub risk 8 (Corrosive), where as in the U.S. it is only classified as 2.2 (Non Flammable Gas).

People who handle dangerous goods will often wear protective equipment, and metropolitan [fire departments](#) often have a response team specifically trained to

deal with accidents and spills. Persons who may come into contact with dangerous goods as part of their work are also often subject to monitoring or health surveillance to ensure that their exposure does not exceed [occupational exposure limits](#).

Laws and regulations on the use and handling of hazardous materials may differ depending on the activity and status of the material. For example, one set of requirements may apply to their use in the workplace while a different set of requirements may apply to spill response, sale for consumer use, or transportation. Most countries regulate some aspect of hazardous materials.

The most widely applied regulatory scheme is that for the transportation of dangerous goods. The [United Nations Economic and Social Council](#) issues the [UN Recommendations on the Transport of Dangerous Goods](#), which form the basis for most regional and national regulatory schemes. For instance, the [International Civil Aviation Organization](#) has developed regulations for air transport of hazardous materials that are based upon the UN Model but modified to accommodate unique aspects of air transport. Individual airline and governmental requirements are incorporated with this by the [International Air Transport Association](#) to produce the widely used [IATA Dangerous Goods Regulations](#) (DGR)^[1]. Similarly, the [International Maritime Organization](#) has developed the [International Maritime Dangerous Goods Code](#) ("IMDG Code", part of the [International Convention for the Safety of Life at Sea](#)) for transportation on the high seas, and the [Intergovernmental Organisation for International Carriage by Rail](#) has developed the Regulations concerning the International Carriage of Dangerous Goods by Rail ("RID", part of the [Convention concerning International Carriage by Rail](#)). Many individual nations have also structured their dangerous goods transportation regulations to harmonize with the UN Model in organization as well as in specific requirements.

The [Globally Harmonized System of Classification and Labeling of Chemicals](#) (GHS) is an internationally agreed upon system set to replace the various different classification and labeling standards used in different countries. GHS will use consistent criteria for classification and labeling on a global level.

Dangerous goods are divided into classes on the basis of the specific chemical characteristics producing the risk.

Note: The graphics and text in this article representing the dangerous goods safety marks are derived from the United Nations-based system of identifying dangerous goods. Not all countries use precisely the same graphics (label, [placard](#) and/or text information) in their national regulations. Some use graphic symbols, but without English wording or with similar wording in their national language. Refer to the Dangerous Goods Transportation Regulations of the country of interest.

IMDG Ex. 1 Insert the appropriate verb in the right place in the sentences below

IMDG Code or International Maritime Dangerous Goods Code is as an international guideline to the safe transportation or shipment of dangerous goods or hazardous materials by water on vessel. IMDG Code is to protect crew members and to marine pollution in the safe transportation of hazardous materials by vessel. It is to governments for adoption or for use as the basis for national regulations. (*recommended, intended, accepted, prevent*)

IMDG Ex. 2 Supply the missing term:

The implementation of the Code is in conjunction with the obligations of the members of United Nation government under the International Convention for the of Life at Sea (SOLAS) and the International Convention for the Prevention of from Ships (MARPOL 73/78). It is intended for use not only by the but also by all those involved in industries and services connected with. It contains advice on terminology, packaging, labeling, placarding, markings, stowage, segregation, handling, and. (*emergency response, Safety, mandatory, shipping, mariner, Pollution*)

IMDG Ex. 3 Supply the missing term:

Dangerous goods, also called _____ **materials** or **HazMat**, are solids, _____, or gases that can harm people, other living organisms, property, or the _____. They are often subject to chemical regulations. "HazMat teams" are _____ specially trained to handle dangerous goods. Dangerous goods include materials that are radioactive, _____, explosive, corrosive, oxidizing, asphyxiating, biohazardous, toxic, pathogenic, or allergenic. Also included are _____ conditions such as compressed gases and liquids or hot materials, including all goods containing such materials or _____, or may have other characteristics that render them hazardous in specific _____.

IMDG Ex. 4 MCT

Dangerous *cargo/goods/commodity* are often indicated by diamond-shaped signage. The colours of each *cube/sphere/diamond* in a way has reference to its hazard i.e.: Flammable = *violet/red/green* because fire and heat are generally of this colour, Explosive = orange, because mixing red (flammable) with yellow (oxidising agent) *extinguishes/extinguishes/creates* orange. Non Flammable Non Toxic Gas = green, due to all compressed air *vessels/ships/barges* being this colour in France after World War II. France is where the diamond system of *HazMat/AtoNavs/NavAids* identification originated.

Increasing/Endangering/Mitigating the *risks/insurance/claims* associated with hazardous materials may require the application of safety precautions during their transport, use, storage and disposal. Most countries regulate hazardous materials by *custom/rule/law*, and they are *subject/object/concern* to several international treaties as well. Even so, different countries may use different class diamonds for the same product.

IMDG Ex. 5 Match the sentences below (the sentences in column No. 2 are shown in the correct order):

People who handle dangerous goods will often wear protective equipment, and	subject to monitoring or health surveillance to ensure that their exposure does not exceed occupational exposure limits.
Persons who may come into contact with dangerous goods as part of their work are also often	depending on the activity and status of the material.
Laws and regulations on the use and handling of hazardous materials may differ	metropolitan fire departments often have a response team specifically trained to deal with accidents and spills.
For example, one set of requirements may apply to their use in the workplace	some aspect of hazardous materials.
Most countries regulate	while a different set of requirements may apply to spill response, sale for consumer use, or transportation.

IMDG Ex. 6 Put one question of the YES/NO type and one of the Question-Word (QW) type to each of the sentences below:

The most widely applied regulatory scheme is that for the transportation of dangerous goods.	(YES/NO)
	(QW)
<i>The UN Recommendations on the Transport of Dangerous Goods</i> forms the basis for most regional and national regulatory schemes.	
The International Civil Aviation Organization has modified UN Model to accommodate unique aspects of air transport.	

<p>The IMDG Code is a part of the International Convention for the Safety of Life at Sea.</p>	
<p>Many individual nations have harmonized their transportation regulations with the UN Model in organization.</p>	
<p>The Globally Harmonized System of Classification and Labeling of Chemicals (GHS) is an internationally agreed upon system set to replace the various different classification and labeling standards used in different countries.</p>	
<p>GHS will use consistent criteria for classification and labeling on a global level.</p>	
<p>Dangerous goods are divided into classes on the basis of the specific chemical characteristics producing the risk.</p>	

Classification and labeling summary tables

Class 1: Explosives

IMDG Ex. 7 Supply the appropriate word qualifying the type of hazard: (insensitive, minor, mass, blast, severe, extremely)

The Canadian Transportation of Dangerous Goods Regulations provides a description of compatibility groups.

- 1.1 Explosives with a _____ explosion hazard
 - Ex: TNT, dynamite, nitroglycerine.
- 1.2 Explosives with a _____ projection hazard.
- 1.3 Explosives with a fire, _____ or projection hazard but not a mass explosion hazard.
- 1.4 _____ fire or projection hazard (includes ammunition and most consumer fireworks).
- 1.5 An _____ substance with a mass explosion hazard (explosion similar to 1.1)
- 1.6 _____ insensitive articles.

IMDG Ex. 8 Look up the captions for the images below and supply the missing terms

- 1.1 — Explosives with a _____ hazard. ([nitroglycerin/dynamite](#))
 1.2 — Explosives with a _____ hazard.
 1.3 — Explosives with a _____ hazard. (rocket propellant, display fireworks)
 1.4 — Explosives with a _____ hazard. (consumer [fireworks](#), ammunition)
 1.5 — _____ agents.
 1.6 — _____ explosives.

	Hazardous Materials Class 1: Explosives		Hazardous Materials Class 1.1: Explosives		Hazardous Materials Class 1.2: Explosives
		Mass Explosion Hazard		Blast/Projection Hazard	
	Hazardous Materials Class 1.3: Explosives		Hazardous Materials Class 1.4: Explosives		Hazardous Materials Class 1.5: Blasting Agents
Minor Blast Hazard		Major Fire Hazard		Blasting Agents	
			Hazardous Materials Class 1.6: Explosives		
		Extremely Insensitive Explosives			

IMDG Ex. 9 Look up the meaning of the words in an on-line a dictionary and match them with the adjectives describing gases below:

compressed,	a solid substance mixed into the liquid so that it becomes included in it
liquefied	reduced or squeezed in size by pressure
dissolved,	a substance that can kill you or make you ill if you eat, drink, or breathe it
poisonous,	a substance contains chemicals that can cause damage by rusting
corrosive	made or become liquid

IMDG Ex. 10 Check the pronunciation for the highlighted terms below, pronounce them using the transcribed form, and then write the word in the left column:

	/ə'setə,li:n/
	/'hʌɪdrədʒ(ə)n/
	'nʌɪtrədʒ(ə)n/
	'ni:ðn/
	/'flʊəri:n, 'flɔ:ri:n/
	/'klɔ:ri:n/
	/'sʌɪənʌɪd/
	,nʌɪtrə(ʊ)'glɪs(ə)ri:n,
	/'dʌɪnəmʌɪt/
	/'gæsəli:n/
	/'æsɪtəʊn/
	'hʌɪdrədʒ(ə)n 'sʌɪənʌɪd/
	/'kɛrəsi:n/
	/dʌɪ'sʌlfʌɪd/

Class 2: Gases

Gases which are compressed, liquefied or dissolved under pressure as detailed below. Some gases have subsidiary risk classes; poisonous or corrosive.

2.1 **Flammable Gas:** Gases which ignite on contact with an ignition source, such as [acetylene](#) and [hydrogen](#) /

- 2.2 **Non-Flammable Gases:** Gases which are neither flammable nor poisonous. Includes the cryogenic gases/liquids (temperatures of below -100°C) used for cryopreservation and rocket fuels, such as [nitrogen](#) and [neon](#).
- 2.3 **Poisonous Gases:** Gases liable to cause death or serious injury to human health if inhaled; examples are [fluorine](#), [chlorine](#), and [hydrogen cyanide](#).

 <p>Hazardous Materials Class 2.1: Flammable Gas</p>	 <p>Hazardous Materials Class 2.2: Nonflammable Gas</p>	 <p>Hazardous Materials Class 2.3: Poisonous Gas</p>
 <p>Hazardous Materials Class 2.2: Oxygen (Alternative Placard)</p>	 <p>Hazardous Materials Class 2.3: Inhalation Hazard (Alternative Placard)</p>	

IMDG Ex. 9 Look up the meaning of the words in an on-line a dictionary and match them with the adjectives describing gases below:

compressed,	a solid substance mixed into the liquid so that it becomes included in it
liquefied	reduced or squeezed in size by pressure
dissolved,	a substance that can kill you or make you ill if you eat, drink, or breathe it
poisonous,	a substance contains chemicals that can cause damage by rusting
corrosive	made or become liquid

IMDG Ex. 10 Check the pronunciation for the highlighted terms below, pronounce them using the transcribed form, and then write the word in the left column:

	/ə'setə,li:n/
	/'hʌɪdrədʒ(ə)n/
	'nʌɪtrədʒ(ə)n/
	'ni:ɒn/
	/'flʊəri:n, 'flɔ:ri:n/
	/'klo:ri:n/
	/'sʌɪənʌɪd/
	,nʌɪtrə(ʊ)'glɪs(ə)ri:n,
	/'dʌɪnəmʌɪt/
	/'gæsəli:n/
	/'æsɪtəʊn/
	'hʌɪdrədʒ(ə)n 'sʌɪənʌɪd/
	/'kɛrəsi:n/
	/dʌɪ'sʌlfʌɪd/

IMDG Ex. 11 Supply the missing term (poisonous, fuels, liquefied, subsidiary, flammable, ignite, inhaled)

Class 2: Gases

Gases which are compressed, _____ or dissolved under pressure as detailed below. Some gases have subsidiary risk classes; _____ or corrosive.

2.1 **Flammable Gas:** Gases which _____ on contact with an ignition source, such as [acetylene](#) and [hydrogen](#) /

- 2.2 **Non-Flammable Gases:** Gases which are neither _____ nor poisonous. Includes the cryogenic gases/liquids (temperatures of below -100°C) used for cryopreservation and rocket _____, such as [nitrogen](#) and [neon](#).
- 2.3 **Poisonous Gases:** Gases liable to cause death or serious injury to human health if _____; examples are [fluorine](#), [chlorine](#), and [hydrogen cyanide](#).

IMDG Ex. 12 Look up the meaning of the words in an on-line dictionary and match them with the adjectives describing gases below:

compressed,	a solid substance mixed into the liquid so that it becomes included in it
liquefied	reduced or squeezed in size by pressure
dissolved,	a substance that can kill you or make you ill if you eat, drink, or breathe it
poisonous,	a substance contains chemicals that can cause damage by rusting
corrosive	made or become liquid

IMDG Ex. 13 Check the pronunciation for the highlighted terms below, pronounce them using the transcribed form, and then write the word in the left column:

	/ə'setə,li:n/
	/'hʌɪdrədʒ(ə)n/
	'nʌɪtrədʒ(ə)n/
	'ni:ðn/
	/'flʊəri:n, 'flɔ:ri:n/
	/'klɔ:ri:n/
	/'sʌɪənʌɪd/
	ˌnʌɪtrə(ʊ)'ɡlɪs(ə)ri:n,
	/'dʌɪnəmʌɪt/
	/'gæsəli:n/
	/'æsɪtəʊn/
	'hʌɪdrədʒ(ə)n 'sʌɪənʌɪd/

	/'kɛrəsi:n/
	/dʌɪ 'sʌlfʌɪd/

IMDG Ex. 13 Supply the missing preposition

Class 2: Gases

Gases which are compressed, liquefied ____ dissolved under pressure ____ detailed below. Some gases have subsidiary risk classes; poisonous or corrosive.

2.1 Flammable Gas: Gases which ignite on contact ____ an ignition source, such as [acetylene](#) ____ [hydrogen](#) /

- **2.2 Non-Flammable Gases:** Gases which are neither flammable nor poisonous. Includes the cryogenic gases/liquids (temperatures ____ below -100°C) used for cryopreservation and rocket fuels, such ____ [nitrogen](#) and [neon](#).
- **2.3 Poisonous Gases:** Gases liable ____ cause death or serious injury ____ human health if inhaled; examples are [fluorine](#), [chlorine](#), ____ [hydrogen cyanide](#).

Class 3: Flammable Liquids

Flammable liquids included in Class 3 are included in one of the following packing groups:

- Packing Group I, if they have an initial boiling point of 35°C or less at an absolute pressure of 101.3 kPa and any [flash point](#), such as [diethyl ether](#) or [carbon disulfide](#);
- Packing Group II, if they have an initial boiling point greater than 35°C at an absolute pressure of 101.3 kPa and a flash point less than 23°C, such as [gasoline \(petrol\)](#) and [acetone](#); or
- Packing Group III, if the criteria for inclusion in Packing Group I or II are not met, such as [kerosene](#) and [diesel](#).

Note: For further details, check the Dangerous Goods Transportation Regulations of the country of interest.

IMDG Ex. No. 15 Look up the following words in a monolingual English dictionary and find their definitions:

TERM	Definition	CROATIAN
<i>boiling point</i>		
<i>flash point</i>		
<i>absolute pressure</i>		

Class 4: Flammable Solids

	<p>Hazardous Materials</p> <p>Class 4.1: Flammable Solids</p>		<p>Hazardous Materials</p> <p>Class 4.2: Spontaneously Combustible Solids</p>		<p>Hazardous Materials</p> <p>Class 4.3: Dangerous when Wet</p>
---	---	---	---	--	---

4.1 **Flammable Solids:** Solid substances that are easily ignited and readily combustible ([nitrocellulose](#), [magnesium](#), safety or strike-anywhere [matches](#)).

4.2 **Spontaneously Combustible:** Solid substances that ignite spontaneously (aluminium [alkyls](#), [white phosphorus](#)).

4.3 **Dangerous when Wet:** Solid substances that emit a flammable gas when wet or react violently with water ([sodium](#), [calcium](#), [potassium](#), [calcium carbide](#)).

IMDG Ex. No. 16 Supply the missing terms

	<p>Hazardous Materials</p> <p>Class 4.1: Flammable _____</p>		<p>Hazardous Materials</p> <p>Class 4.2: Spontaneously Combustible _____</p>		<p>Hazardous Materials</p> <p>Class 4.3: _____ when Wet</p>
--	--	--	--	---	---

4.1 _____ **Solids:** Solid substances that are easily _____ and readily combustible ([nitrocellulose](#), [magnesium](#), safety or strike-anywhere [matches](#)).

4.2 **Spontaneously _____:** Solid _____ that ignite spontaneously (aluminium [alkyls](#), [white phosphorus](#)).

4.3 **Dangerous when _____:** Solid substances that _____ a flammable gas when wet or _____ violently with water ([sodium](#), /pəˈtɑːsɪəm/, [potassium](#), [calcium carbide](#)).

Class 5: Oxidizing Agents and Organic Peroxides

	<p>Hazardous Materials</p> <p>Class 5.1: Oxidizing Agent</p>		<p>Hazardous Materials</p> <p>Class 5.2: Organic Peroxide Oxidizing Agent</p>
---	--	--	---

5.1 Oxidizing agents other than organic peroxides ([calcium hypochlorite](#), [ammonium nitrate](#), [hydrogen peroxide](#), [potassium permanganate](#)).

5.2 Organic peroxides, either in liquid or solid form ([benzoyl peroxides](#), [cumene hydroperoxide](#)).

IMDG Ex. No. 17 Class 4, 5, 6

Class 6: Toxic and Infectious Substances

 <p>Hazardous Materials</p> <p>Class 6.1: Poison</p>	 <p>Hazardous Materials</p> <p>Class 6.2: _____</p>
---	--

- 6.1a Toxic _____ which are liable to cause death or serious _____ to human health if inhaled, swallowed or by skin absorption ([potassium cyanide](#), [mercuric chloride](#)).
- 6.1b (Now PGIII) _____ substances which are harmful to human _____ (N.B this symbol is no longer authorized by the United Nations) ([pesticides](#), [methylene chloride](#)).
- 6.2 Biohazardous substances; the World Health Organization (WHO) divides this class into two categories: **Category A:** Infectious; and **Category B:** Samples (virus cultures, pathology specimens, used intravenous needles).

Class 7: Radioactive Substances

Radioactive substances comprise substances or a combination of substances which emit ionizing radiation ([uranium](#), [plutonium](#)).

Class 8: Corrosive Substances

Corrosive substances are substances that can dissolve organic tissue or severely corrode certain metals:

- **8.1 Acids:** [sulfuric acid](#), [hydrochloric acid](#)
- **8.2 Alkalis:** [potassium hydroxide](#), [sodium hydroxide](#)

Class 9: Miscellaneous

Hazardous substances that do not fall into the other _____ (asbestos, air-bag inflators, self inflating life rafts, dry ice).

Other hazardous materials labels (CHIP)

	Hazardous Materials Hazard Symbol: <i>C/Corrosive</i>		Hazardous Materials Hazard Symbol: <i>E/Explosive</i>		Hazardous Materials Hazard Symbol: <i>F/Flammable</i>
	Hazardous Materials Hazard Symbol: <i>N/Environmental Hazard</i>		Hazardous Materials Hazard Symbol: <i>O/Oxidizing</i>		Hazardous Materials Hazard Symbol: <i>T/Toxic</i>
	Hazardous Materials Hazard Symbol: <i>Xn/Harmful;</i> <i>Xi/Irritant</i>				

Europe

The [European Union](#) has passed numerous [directives](#) and regulations to avoid the dissemination and restrict the usage of hazardous substances, important ones being the [Restriction of Hazardous Substances Directive](#) and the [REACH](#) regulation. There are also long-standing European treaties such as [ADR](#) and RID that regulate the transportation of hazardous materials by road, rail, river and inland waterways, following the guide of the UN Model Regulation.

European law distinguishes clearly between the law of dangerous goods and the law of hazardous materials. The first refers primarily to the transport of the respective goods including the interim storage, if caused by the transport. The latter describes the requirements of storage (including warehousing) and usage of hazardous materials. This distinction is important, because different directives and orders of European law are applied.

IMDG Ex. No. Supply the missing words:

The European Union has _____ numerous directives and regulations to _____ the dissemination and restrict the usage of hazardous _____, important ones being the Restriction of Hazardous Substances Directive and the REACH regulation. There are also long-standing European treaties such as ADR and RID that regulate the transportation of hazardous materials by road, rail, river and _____ waterways, following the guide of the UN Model Regulation.
(*avoid, passed, inland, substances*)

IMDG Ex. No. Fit the missing words into the right place:

European law clearly between the law of dangerous goods and the law of hazardous materials. The primarily to the transport of the respective goods including the interim storage, if caused by the transport. The describes the requirements of (including warehousing) and usage of hazardous materials. This is important, because different directives and orders of European law are applied.
(*distinction, distinguishes, latter, caused, refers, first, storage*)

United Kingdom

The [United Kingdom](#) (and also [Australia](#), [Malaysia](#), and [New Zealand](#)) use the [Hazchem](#) warning plate system which carries information on how an emergency service should deal with an incident. The *Dangerous Goods Emergency Action Code List* (EAC) lists dangerous goods; it is reviewed every two years and is an essential compliance document for all emergency services, local government and for those who may control the planning for, and prevention of, emergencies involving dangerous goods. The latest 2009 version is available from the [National Chemical Emergency Centre](#) (NCEC) website^[3] and as a book^[4].

Transport documents

One of the transport regulations is that, as an assistance during emergency situations, written instructions how to deal in such need to be carried and easily accessible in the driver's cabin.

A license or permit card for hazmat training must be presented when requested by officials.

Dangerous goods shipments also require a special declaration form prepared by the shipper. Among the information that is generally required includes the shipper's name and address; the consignee's name and address; descriptions of each of the dangerous goods, along with their quantity, classification, and packaging; and emergency contact information. Common formats include the one issued by the [International Air Transport Association](#) (IATA) for air shipments and the form by the [International Maritime Organization](#) (IMO) for sea cargo.
